

new_school functionality

Leave It Better Than You Found It

This document translates the three client messages into one build-ready module spec for the current FrantzCoutard.com site. It defines the school challenge flow, required data capture, consent and approval gates, business interview logging, final submission rules, dashboards, admin controls, and the technical approach for the existing React + PHP + MySQL stack.

Ages 14-19 Students only, with parent or guardian consent required.	10 interviews Each student must log ten local business visits before submission unlocks.	\$5,000 total First, second, and third place scholarship awards.	
Parent QR consent The parent approves through a unique QR flow tied to the student profile.	School approval School staff confirm enrollment and validate the consent record.	Teacher approval Teachers monitor progress and confirm participation inside the school context.	Admin review Admins export submissions, winners.

Winner announcement: August 25, 2026

Built for the existing site, not a separate product

1. Challenge analysis

Program overview and stakeholders

The three client messages describe one system: a school-based challenge portal that turns community discovery into a structured project workflow. The site must capture people, approvals, evidence, submissions, and winners in one controlled flow.

What the challenge asks students to do

- Interview ten local businesses in their neighborhood.
- Identify opportunities for improvement and propose a practical solution.
- Explain how the solution could improve visibility, attract customers, increase sales, strengthen engagement, improve operations, or better serve the community.
- Submit a 1 minute 30 second video and a one-page written summary.

Who participates

- Students ages 14-19 are the primary participants.
- Parents or other adult consent is required before participation becomes active.
- Schools request to interview students and keep the program tied to a local school context.
- Admins review submissions, export data, choose winners, and publish the results.

Why it matters

- It builds leadership, communication, business awareness, problem-solving skills, and community engagement.
- It gives students a real reason to study local businesses and think critically about neighborhood needs.
- It turns a student competition into a practical community impact program with measurable output.

2. Workflow

Workflow and gating logic

The system is a gated pipeline. Each stage unlocks the next one only when the previous stage is complete and stored with the correct approval or evidence record.

3. Registration

Student registration and parent consent

The student creates the first record. Parent data is not typed into the student form; it is captured only after the QR code is scanned and the parent completes the consent flow.

Student registration fields

- Student full name
 - Date of birth (must be between 14 and 19)
 - Phone number
 - Home address
 - School name
 - Grade level
 - Parent level guardian name
 - Parent phone number
 - Parent email
 - Student username and password
- ## Outputs after registration
- Student dashboard access
 - Unique QR code for parent consent
 - Status tracker starting at Student Registered

Parent consent via QR code

- Parent full name
 - Relationship to student
 - Phone number
 - Home address
 - Government ID upload optional
 - Consent checkbox
 - Date and time of approval
- Parent must confirm they are the parent or legal guardian and understand that school verification is required.

4. School setup

School registration, school approval, and teacher onboarding

Schools and teachers are separate roles, but they are connected by the school record. School staff validate the student, and teachers monitor the student progress inside that school context.

School registration fields

School name
School address
Main phone number
Principal name
Administrator email
Administrator phone number
School account login

School approval fields

School staff name
School email
Approval status
Digital signature
Date and time of approval

Teacher onboarding

Teacher full name
Teacher email
Phone number
Role or Department
Grade level supported
Teacher login

Teacher approval fields: teacher name, teacher email, student name, approval status, notes, and date/time.

Teacher dashboard outputs

Students assigned to teacher
Approval status
School progress
Business interviews submitted
Final project submission status

5. Evidence capture

Student business interview module

This is the core evidence layer of the challenge. Each student must record ten local businesses, with enough context to explain what was discovered and what opportunity exists for improvement.

Interview prompts from the client

Does the business have a website?
Does the business have a Google Business Profile?
Does the business have a social media presence?
Does the business have any loyalty or rewards programs?
Does the business have its own ordering platform?
What is the business's biggest challenge facing the business?
What opportunities are being missed?

Required business entry fields

Business name
Owner or manager name
Business phone number
Business address
Business category
Website yes or no
Google Business Profile yes or no
Social media yes or no
Online ordering yes or no
Delivery or pickup yes or no
Main challenge identified
Student notes

Unlock rule

The final submission step remains locked until all ten business interviews are completed and the records are stored as valid entries. This keeps the challenge evidence-based instead of opinion-based.

6. Final review

Final submission and admin review

Once all approvals and business interviews are complete, the student can submit the final project package. Admin review closes the loop, scores entries, and publishes the winners.

Final submission requirements

Video upload with a maximum runtime of 1 minute and 30 seconds.

Problem identified.

Why it matters.

Proposed solution.

Expected impact.

Submission date.

The one-page written summary must also include business name, owner name, address, phone number, and date of visit.

Admin dashboard requirements

View total students registered, total parents registered, total schools registered, total teachers registered, total

businesses interviewed, total submissions, and winners.

See pending parent consent, school approval, teacher approval, and eligible students.

Approve/reject submissions, parent consent, school approval, teacher approval, and every business entry submitted.

View student profiles, parent consent, school approval, teacher approval, and every business entry submitted.

Select winners and publish them to FrantzCoutard.com.

Prize structure and announcement

First place: \$2,500 scholarship award.

Second place: \$1,000 scholarship award.

Third place: \$500 scholarship award.

Winners announced on August 25, 2026 at FrantzCoutard.com.

Public pages and dashboard overview

The website needs both public-facing challenge pages and logged-in dashboards so every role can see the exact information it needs.

Public pages needed

- Homepage section: Leave It Better Than You Found It, The Future Belongs To Problem Solvers, \$5,000 in scholarship awards, and Register Free at Frantz Coutard.com.
- Challenge page: overview, who can participate, how it works, prize details, rules, consent requirements, FAQ, and register button
- Registration pages: student registration, parent consent via QR code, school registration, and teacher registration
- Dashboard pages: student dashboard, parent dashboard, school dashboard, teacher dashboard, and admin dashboard.

Dashboard roles at a glance

- Student dashboard: participant ID, QR code, status tracker, interview progress, and submission status.
- Parent dashboard: consent record, approval status, date/time, and student linkage
- School dashboard: registered students, pending approvals, approved students, submitted projects, and winners from that school
- Teacher dashboard: assigned students, approval states, interviews entered, project status, leaderboard data, reports, notifications, and award progress
- Admin dashboard: totals, pending approvals, submissions, exports, winner selection, and publication.

8. Teacher focus

Teacher dashboard requirements

The teacher dashboard is the monitoring and motivation layer for the challenge. It should help teachers see progress, identify gaps, and compete for the educator award.

Teacher dashboard must include

- Teacher profile: teacher name, school name, email, phone number, role or department, and grade level supported
- Student tracking: total students registered, students pending parent consent, students approved by parent, students approved by school, students with teacher approval, and students eligible to submit
- Business interview tracking: total business interviews entered, interviews completed per student, students with all 10 interviews completed, and business categories collected
- Project submission tracking: video submitted, written summary submitted, final submission status, submission date, and student ranking status
- Community impact score: score based on registration, consent, school consent, business interviews, project submissions, finalists, and winners
- Reports: export student list, parent consent status, business interview data, project submission data, and teacher score report
- Notifications: parent consent pending, school approval pending, student missing interviews, student submission deadline reminder, and award ranking updates.

Teacher award section

The teacher dashboard should show progress toward the Community Leadership Educator Award. Prize package: Teacher Excellence Vacation Experience, including roundtrip airfare, hotel accommodations, ground transportation, recognition experience, and the Community Leadership Educator Award.

Main goal: help teachers monitor students, increase participation, track impact, and compete for the award

9. Technical plan

How this fits the current site

The new_school module should be added to the current FrantzCoutard.com architecture instead of being built as a separate product. That keeps the brand, session model, and admin patterns consistent.

Recommended implementation approach

- Add a new school module in the React frontend with pages for student registration, parent consent, school registration, teacher registration, dashboards, and admin review.
- Extend the PHP API with routes for registration, QR token validation, approvals, dashboard summaries, interview entries, submissions, exports, and winner publishing.
- Add MySQL tables for students, parents, schools, teachers, approvals, business interviews, submissions, notifications, QR tokens, and winners.
- Use the current upload pattern for files such as consent signatures, student videos, and written submissions.

Suggested API routes

```
POST new-school/student/register - create student profile and participant QR token.
POST new-school/parent/register - create parent approval from the QR flow.
POST new-school/teacher/register - create teacher account.
POST new-school/business - save one business interview record.
POST new-school/submission - save one video and written submission.
GET and PUT admin/new-school/* - admin review, exports, and winners.
```

Suggested database entities

```
new_school_students - student profile, school, grade, status, QR token, participant ID
new_school_parents - parent record, relationship, contact details, signature, approval time.
new_school_schools - school account and identity fields
new_school_teachers - teacher account and school assignment
new_school_approvals - school and teacher approvals with roles and timestamps
new_school_interviews - business visits per student and interview answers.
new_school_submissions - pending, reminder, and award messages.
new_school_winners - final ranking and prize publication records.
```

Acceptance criteria

```
Student cannot submit without parent, school, and teacher approval.
Every information is audited date, time, and signature.
Admin can export data, choose winners, and publish the result page.
Teacher dashboard shows progress, rankings, and award status.
```
